

## **ABSTRACT**

A trimming and edging attachment for all types of riding mowers and garden tractors used for residential and commercial needs. The attachment consist of a mounting plate to mount to the front of the mower with three sections of arms extending outward to the left of said mower and just ahead of the left front wheel. The trim head is powered from an engage mechanism with a drive belt off of the main shaft of the mower motor. The power of the pneumatic cylinders that operate the up and down motion of the arms comes from a twelve volt dc motor and pump combination. This pump is an on demand pump and only operates when some type of adjustment or movement is needed. This unit does not depend on the mowing deck to be in operation while using the trim and edge attachment.
